Raw material tracking

Raw material tracking - Scanning a barcode on the box/pallet transmits data to the Factbird cloud software, documenting raw material batch information along with production data.

Once the information is in Factbird, it can be documented and further analyzed using Power BI, which automates customized dashboards/reports.

1 Start scanning barcodes to log information

Scanning a barcode automatically creates an "annotation" with the barcode on the live graph on the "LIVE" page. Each "annotation" is time-stamped.

Scanning raw material batch information

The information, e.g., raw material batch info, on each annotation can be documented and analyzed with production data in Factbird, such as production batch info and product info by using Power BI.
